        What if Data is imabalanced
            1. As a part of this task you will observe how linear models work in case of data imbalanced
            2. observe how hyper plane is changs according to change in your learning rate.
            3. below we have created 4 random datasets which are linearly separable and having class imbalance
            4. in the first dataset the ratio between positive and negative is 100 : 2, in the 2nd data its 100:20,
            in the 3rd data its 100:40 and in 4th one its 100:80
In [8]:
          # here we are creating 2d imbalanced data points
          ratios = [(100,2), (100, 20), (100, 40), (100, 80)]
          plt.figure(figsize=(20,5))

                                        0.10
               your task is to apply SVM (sklearn.svm.SVC) and LR (sklearn.linear_model.LogisticRegression) with different regularization strength [0.001, 1, 100]
         Task 1: Applying SVM
            1. you need to create a grid of plots like this
            in each of the cell[i][j] you will be drawing the hyper plane that you get after applying SVM on ith dataset and
                     jth learnig rate
            i.e
                                                             \label{eq:plane} Plane(SVM().fit(D1, C=0.001)) \quad Plane(SVM().fit(D1, C=1)) \quad Plane(SVM().fit(D1, C=100)) \\
                                                             Plane(SVM().fit(D2, C=0.001)) Plane(SVM().fit(D2, C=1)) Plane(SVM().fit(D2, C=100))
                                                             \label{eq:plane} Plane(SVM().fit(D3, C=0.001)) \quad Plane(SVM().fit(D3, C=1)) \quad Plane(SVM().fit(D3, C=100)) \\
                                                             Plane(SVM().fit(D4, C=0.001)) Plane(SVM().fit(D4, C=1)) Plane(SVM().fit(D4, C=100))
            if you can do, you can represent the support vectors in different colors,
            which will help us understand the position of hyper plane
             Write in your own words, the observations from the above plots, and
            what do you think about the position of the hyper plane
            check the optimization problem here https://scikit-learn.org/stable/modules/svm.html#mathematical-formulation
            if you can describe your understanding by writing it on a paper
            and attach the picture, or record a video upload it in assignment.

                                                                                                                   0.10
```

Summary 1. When we have a high imbalanced dataset and a small C value then the SVM is not working well. The Planes are not in the correct area, they are not even classifying the model which is underfitting the model

c=0.001 vs Imbalanced dataset - 4

2. When we started to tune the C value i.e by increasing the C value the model started to classify the most of the points correctly Task 2: Applying LR

Summary
1. When the data is highly imbalanced and if the C value is very low then the hyperplane is very far away from the dataset and not doing any classification
```

2.Once we start to tune the C value and balance the dataset then the model will perform well , in the above figure also we can observe the same
